AMENDMENTS TO THE CLAIMS

Please amend the claims as follows. The following claim amendments are based on entry of the Request for Continued Examination filed on August 30, 2007.

1. – 13. (Cancelled)

14. (Currently Amended) A method for synchronizing a first database with a second database in a system comprising:

    storing a synchronization object as a last synchronization object associated with the first database in a memory of a removable subscriber identity module after a first synchronization of the first and second database, wherein the last synchronization object indicates a state of the first database before any modifications to the first database are made after the first synchronization;

    generating, by the removable subscriber identity module, a new synchronization object associated with the first database when the removable subscriber identity module receives a request that the new synchronization object be associated to the first database ~~for a new synchronization~~; and

    storing the new synchronization object in the memory of the removable subscriber identity module~~;~~

    ~~wherein the system comprises a plurality of devices;~~

    ~~wherein the first database is stored in the removable subscriber identity module;~~

    ~~wherein the second database is stored in at least one device from the plurality of devices in the system, and~~

    ~~wherein the removable subscriber identity module is configured to communicate with at least one device from the plurality of devices in the system.~~

15. (Previously Presented) The method according to claim 14, further comprising:

> reading the new synchronization object associated with the first database when the new synchronization is requested between the first and the second database;

> comparing the new synchronization object associated with the first database with a synchronization object associated with the second database; and

> modifying at least one of the first and the second databases to synchronize the first database with the second database when a comparison between the new synchronization object associated with the first database and the synchronization object associated with the second database indicates that the first and the second database have been previously synchronized and modifications have occurred since the previous synchronization.

16. (Previously Presented) The method according to claim 15, further comprising:

> notifying the removable subscriber identity module when the new synchronization is initiated between the first database and the second database,

> wherein the removable subscriber identity module provides the last synchronization object and the new synchronization object; and

> wherein the new synchronization object is stored as the last synchronization object after the successful completion of the new synchronization of the first database with the second database.

17. (Currently Amended) The method according to claim 14,

> wherein a program in at least one of the devices from the plurality of _a_ device[[s]] having the second database requests any modifications performed in the first database after the first synchronization, and

> wherein the removable subscriber identity module sends a response comprising the new synchronization object associated with the first database.

18. (Currently Amended) The method according to claim 17,

    wherein ~~at least one device from the plurality of~~ the device[[s]] having the second database stores a local copy of the removable subscriber identity module memory; and

    wherein the ~~at least one~~ device ~~from the plurality of devices~~ is configured to obtain desired data in the first database from the local copy before proceeding with the new synchronization.

19. (Currently Amended) The method according to claim 14,

    wherein ~~the at least one~~ _a_ device[[s]] ~~from the plurality of devices~~ having the second database notifies the removable subscriber identity module that the synchronization is successful,

    wherein the removable subscriber identity module replaces the last synchronization object with a new synchronization object,

    wherein the new synchronization object is used to detect modifications to the first database after the last synchronization.

20. (Canceled)

21. (Previously Presented) A system comprising:

a plurality of devices, wherein at least one device from the plurality of devices is a removable subscriber identity module;

wherein the removable subscriber identity module is configured to communicate with at least another device from the plurality of devices and adapted to comprise a first database; and

wherein at least one device from the plurality of devices is adapted to comprise a second database; and

wherein the removable subscriber identity module comprises:

a memory;

a synchronization object stored as a last synchronization object associated with the first database in the memory after a first synchronization of the first and the second database; and

a new synchronization object associated with the first database stored in the memory when the removable subscriber identity module receives a request for a second synchronization,

wherein the last synchronization object indicates a state of the first database before any modifications are made to the first database after the first synchronization,

wherein the removable subscriber identity module is configured to generate the new synchronization object.
